     Any new protein or DNA marker is potentially useful to add detail to
     already constructed genetic chromosome maps and may be valuable in
     breeding programs wherever polymorphism exists. Non-gluten proteins
     represent 15-20% of total wheat grain proteins. Isoelec.
     focusing of wheat (Triticum aestivum L. em Thell.) proteins on ultrathin gels showed high resoln. and was found to be a useful tool in the
     differentiation of wheat varieties. Seventeen hexaploid wheat varieties
     were screened to investigate polymorphism of albumin proteins using
     isoelec. focusing. Polymorphism was obsd. for albumin polypeptides of pI 5.20, 5.85, 6.25, and 7.1, and 8.0. The polymorphic protein of pl 7.1 was mapped by analyzing doubled haploid populations from the intervarietal
     crosses, Cranbrook Halberd and Synthetic Opata 85. This protein locus
     was designated as Iha-B1.2, and is located on the short arm of chromosome

WO 1999-AU995
                                                               W 19991111
     A two-site immunoassay for the qual. or quant. detection of .alpha
     .-amylase in a test sample comprises: (i) exposing the test
     sample to a first ("capture") antibody or antibody fragment which specifically or preferentially binds to a first epitope on the .
     alpha.-amylase under conditions permitting binding; (ii)
     subsequently exposing bound .alpha.-amylase to a
     second ("detection") antibody or antibody fragment which specifically or
     preferentially binds to a second epitope on the .alpha.-
     amylase that is distinct from the first epitope, under conditions
     permitting binding of the second antibody or its fragment to the bound .
     alpha.-amylase; and (iii) detecting any binding of the
     second antibody or its fragment to the bound .alpha.-
     amylase, wherein either of the first or second epitopes is an
     epitope comprising one or more of the amino acid sequences:
     IDRLVSIRTRGQIHS, CRDDRPYADG, or VNWVNKVGGS and variants thereof showing
      .gtoreq.80% (preferably .gtoreq.90%) sequence identity. The immunoassay
     is useful for detecting weather damage (i.e., preharvest sprouting) in
     cereal grain. Thus, a rapid tube sandwich ELISA
     detected .alpha.-amylase in preharvest-sprouted wheat
     exts. at .apprx.4 ng/mL.

     A sandwich ELISA was developed for detection of .alpha.-
     amylase in preharvest sprouted wheat and adapted to rapid
     field-use formats requiring 15-20 min to perform. Polyclonal and
     monoclonal antibodies were prepd. to detect a mixt. of high and low pI isoenzymes of .alpha.-amylase and high pI isoenzymes
     only. All antibodies detected .alpha.-amylase on
     immunoblots of either a crude wheat ext. or of purified enzyme, but only
     the polyclonal antibodies functioned in a sandwich ELISA. Depending on
     the antibody combination, the tube ELISA detected either the high and low
     pI isoenzymes of .alpha.-amylase or the high pI
     isoenzymes only with a detection limit of .apprxeq.0.5-1.0 ng/mL of amylase. Wheats with falling nos. (FN) of <350 s could be discriminated from sound wheats, with decreasing FN producing increasing assay color.
     Using 130 wheat grain samples, ELISA absorbances for detection
     of both high and low pl isoenzymes and of high pl isoenzymes only were
     highly pos. correlated with amylase enzyme activity and neg. correlated
     with FN. The correlations were similar for detection of both isoenzyme families and for detection of high pI isoenzymes only. Analyses of three
     sets of wheat samples from different environments demonstrated that the
     relationship between ELISA absorbance and FN had little dependence on
     wheat cultivar. The precision of sample anal. using the field ELISA was
```

similar to the precision of FN test app.

A rapid two-site sandwich ELISA was developed for detection of a previously uncharacterized protein encoded at the Ha locus on chromosome 5DS of wheat (Triticum aestivum). The assay used the combined specificity of two antibodies to detect a protein that was sol. in aq. alc. salt solns. and water. It was expressed in the endosperm of all soft wheats and Triticum tauschii accessions tested. The ELISA was highly specific, with no signal obtained with varieties that did not express the protein. The presence of the 5DS-encoded protein correlated with a significant change in both water absorption and av. hardness and particle size indexes in a doubled haploid population derived from a cross between cvs. Cranbrook.times.Halberd. Only some hard varieties expressed this protein indicating that the protein is not predictive for hardness. However, it may be a new factor, or a marker for a new factor, affecting kernel texture. A polypeptide of Mr 66 000 was purified from an ext. of Halberd flour by immunoaffinity chromatog. Its N-terminal amino acid sequence identified it as an albumin with high homol. to both mammalian serum albumins and sucrose synthase from a range of cereals. The assay may be valuable in wheat breeding programs for assessing kernel texture where the parents are of different ELISA phenotype, or for varietal identification, as the expression of the polypeptide is variable

in hard wheat varieties.

Translation elongation factor 1.alpha. (EF-1.alpha.) from cereal embryo was recently reported to be rich in lysine, and the possibility of using this protein as a marker for feed quality was explored in maize. this study we used immunochem. methods to investigate the relationship between the content of EF-1.alpha. and other proteins from wheat germ and lysine content in both hexaploid (bread) wheats and diploid wheat progenitors to the wheat A-genome. The levels of grain lysine, as well as their variation between lines or cultivars, were greater for the diploid wheats. While there was a significant correlation between the levels of EF-1.alpha. and grain lysine content, the binding of antibodies to a protein of Mr 37000 showed a higher correlation. This protein was characterized by amino acid sequencing as fructose

```
1,6-bisphosphate aldolase. The possibility of using fructose
     1,6-bisphosphate aldolase as a marker for feed quality and development of
     a simple ELISA for quantification of lysine in wheat is demonstrated.

     Granule-bound starch synthase (GBSS) is the primary enzyme responsible for
     the synthesis of amylose in amyloplasts of cereal endosperm
     cells. Bread wheats, due to their hexaploid genetic system, carry three
     genes (wx loci) encoding GBSS. Purifn. and sepn. of GBSS from more than
     200 North American hexaploid wheats allowed the indentification of
     genotypes that carry null alleles at either the wx-A1 and wx-B1 loci.
     addn., the cultivar Ike carried both wx-A1 and wx-B1 null alleles. No wx-D1 nulls were detected. Null alleles were found in 10% of the hard
     winter wheats tested, but in only 2% of the samples soft winter wheats.
     Amylose contents of wheats carrying single null alleles at either the
     wx-A1 or wx-B1 loci often were lower than those of wild type wheats, but
```

greater redn. in amylose content was obsd. in Ike. Monoclonal antibodies were used to quantify water-extractable GBSS in both wild-type and null genotypes. Gene dosage compensation was evident, although GBSS content, as measured by ELISA, was significantly lower in Ike than in all other wheats. The indentification of null alleles in

adapted genotypes suggests the development of wheats with a wide range of amylose contents will be possible by simple genetic crossing and selection.

LANGUAGE:

English A double antibody, sandwich ELISA (ELISA) was developed using

polyclonal **antibodies** specific to beta-amylase to est. the amt. of 'free' (sol. in aq. saline soln.) or 'combined' (extd. with saline soln, including reducing agent) beta-amylase protein in barley grain and malt. This ELISA was used to quantify the amt. of beta-amylase in barley grain and malt from four varieties grown at nine sites in South Australia in 1993. The antibody used to develop the ELISA reacted differently with beta-amylase dependent on whether the source was barley grain or malt, and on the

beta-amylase band pattern in isoelec. focussing (IEF) of the barley variety. On the basis of their IEF band patterns barley varieties were divided into two types, designated Bmy1-Sd1 and Bmy1-Sd2. Malting resulted in proteolytic cleavage of the beta-amylase peptide with a redn. in the apparent mol. wt. of up to Mr 4000 and the appearance of new malt beta-amylase IEF bands that were more basic. The new malt beta-amylase IEF band patterns still allowed the identification of the Bmy1-Sd1 and Bmy1-Sd2 IEF types despite the change in mol. wt. and pI. The data obtained using the beta-amylase ELISA were highly correlated with beta-amylase activity for both the free and combined fractions when the IEF band pattern and its source, barley grain or malt, were

taken into account.

DOCUMENT TYPE:

Accurate knowledge of the presence and levels of protectant residues in stored products is important for several reasons: for adequate control of possible infestation, to ensure that levels do not exceed legal Maximum Residue Limits, and to police specifications in sale/export contracts. While residue levels can be accurately detd. by gas-chromatog., the large no. of samples and sampling times required for thorough monitoring led us

to develop an alternative method, suitable for on-site testing. Specific ${\bf antibodies}$ have been employed for the major ${\bf grain}$ protectants used in Australia and overseas: organophosphates (fenitrothion, chlorpyrifos-Me, pirimiphos-methyl), cabaryl, methoprene and synthetic pyrethroids (bioresmethrin, permethrin, phenothrin). Tests for deltamethrin and some other pyrethroids are under development. In addn., other grain protectant compds. such as malathion, methacrifos, dichlorvos, bromophos and etrimfos can be detected using a novel cholinesterase inhibition test. The reagents needed to perform the tests have been packaged into compact test kits, some of which are now com. available. All the immunoassay tests are performed in the same manner: grain or other commodity is extd. by blending in methanol, drops of the ext. added to an antibody-coated microwell or tube followed by drops of an enzyme conjugate soln. After a few minutes, the microwell or tube is washed in water to remove unbound components, then a color developer added. Different levels of protectant in the sample produce graded differences in yellow color. The cholinesterase test is performed similarly. Tests have been tuned for detection in the 0.05/0.1-10 ppm residue range in the commodity. Kits designed for simultaneous testing of a large no. of samples under lab. conditions have also been developed and are suitable for anal. of malted, baked or noodle end-products as well as raw grain. Insecticidal protectants are also important in developing countries. In a new collaboration with Indian scientists, we are extending this work to some other plant-based commodities and organochlorines, fungicides and other organophosphates. Advantages of immunoassay kits here will be the low capital and per-test costs.

Wheat starch contains two classes of assocd. proteins: proteins which are embedded within the granule and loosely assocd. surface proteins. The characterization of the major proteins that are embedded in the granule are described. Gel electrophoresis on the basis of size resolved these proteins into five bands of mol. wts. 60, 75, 85, 100 and 105 kDa. These

NGUYEN 09/830.876

polypeptides were demonstrated to be within the granule by their resistance to proteinase K digestion when granules were ungelatinized. The N-terminal sequences of these polypeptides are reported. The most prominent polypeptide is the 60 kDa granule-bound starch synthase. N-terminal sequence obtained from the 75 kDa polypeptide shows homol. to rice sol. starch synthase. The 85 kDa band was resolved into at least two types of polypeptides, one of which reacted with polyclonal antiserum to the maize branching enzyme IIb. The 100 and 105 kDa polypeptides were located only in the granule and are related, on the basis of N-terminal sequence similarity and cross-reactivity to monoclonal antibodies SDS-PAGE and monoclonal antibody cross-reactivity expts. suggest that the 100 and 105 kDa polypeptides are absent from starch granules from all other species examd., including other cereals. Thus, all the major granule proteins are involved in starch biosynthesis.

A review with 37 refs. The mixing and baking properties of wheaten doughs are detd. largely by the content, compn. and interactions of the major groups of flour proteins, the disulfide-bonded glutenin subunits and monomeric gliadins. Prediction of dough and bread quality is currently based on medium-scale rheol. and baking tests, but the slow throughput of such tests limits their use both by millers and baking companies and in early-generation screening by plant breeders. Thus identification and quantification of sp. flour proteins by immunoassay has the potential advantages of speed, simplicity and applicability to small samples in breeding. Tech. problems can arise from the low solubilities of these proteins and their high degrees of sequence homol. (which often give rise to extensive antibody cross-reaction). These problems can be minimized by modifications to methods and combining monoclonal antibodies with selected extn. conditions to enhance the functional specificity of the assay. Limitations also arise from attempting to predict the behavior of a complex system, in which mol. interactions and processing changes have been important, purely from flour polypeptide compn. The authors have used quant. immunoassays for sp. groups of glutenins and gliadins to predict aspects of dough strength and extensibility, while 'yes-no' direct enzyme-linked immunosorbent assays can be used to screen for products of particular wheat or translocated rye genes assocd. with sp. dough qualities. Monoclonal antibodies are also being employed to purify sp. flour proteins under non-denaturing conditions and in conjunction with novel very small scale dough testing equipment to directly assess functionality in doughs.

Three hundred and eighty-four immobilized overlapping nonapeptides, corresponding to the full amino acid sequences of three high Mr subunits

NGUYEN 09/830,876

of glutenin from bread wheat (Triticum aestivum) grain, were used to det. the linear epitopes recognized by four monoclonal antibodies. These antibodies were selected on the basis of significant and pos. correlations between their binding to wheat flour exts. in a two-site (sandwich) enzyme immunoassay and rheol. measures of dough strength, an important aspect of bread wheat quality. The antibodies did not bind to a single, specific sequence but bound a series of related peptides in each high Mr glutenin subunit examd. The sequences recognized were not identical for the four antibodies, but in each case were in the central repeating domain of the high Mr glutenin subunits, and usually comprised regions that overlapped the degenerate repeat nonamer and hexamer sequences. High Mr glutenin subunits that have been assocd. with greater dough strength, such as the D-genome allelic products 1Dx5 and 1Dy10, displayed an increased no. of the epitope sequences. The location of the epitopes in sequences of overlapping .beta.-turns in the repetitive region supports the hypothesis that dough elasticity arises partly from .beta.-turn-forming secondary structure in the repeat regions of the Mr glutenin subunits. Addnl. .beta.-turns within high Mr subunits may extend their structure to allow increased interaction between the glutenin subunits and with the other proteins of the gluten complex, thus improving dough strength.

Div. Plant Ind., CSIRO, North Ryde, 2113, Australia Food and Agricultural Immunology (1993), 5(3), 129-44 CORPORATE SOURCE: SOURCE:

CODEN: FAIMEZ; ISSN: 0954-0105

DOCUMENT TYPE: Journal

LANGUAGE: English

An improved immunoassay for Reldan in grain was developed, based on an immobilized polyclonal antibody. This assay had greater sensitivity (limit of detection of 0.cntdot.02 ppm in grain, or O.cntdot.05-O.cntdot.1 ppb in buffer), was less susceptible to interference from methanol (used to ext. the residue from grain) and had greater precision than the earlier monoclonal antibody assay (Skerritt, J.H., et al, 1992). The polyclonal antibody exhibited greater cross-reaction with chlorpyrifos-Et (not used as a grain protectant), but less with fenchlorphos and bromophos (used occasionally as grain protectants), and employed a more stable peroxidase conjugate than the monoclonal antibody assay. Good correlations were obtained between Reldan residue levels in wheat grain detd. by the improved immunoassay and by gas chromatog. The properties of the polyclonal antibody should also allow its use in a rapid field assay.

357-69

CODEN: JSTPAR; ISSN: 0022-474X

DOCUMENT TYPE: Journal English LANGUAGE:

In order for grain handlers and traders to reliably est. residues of grain protectants in the field, antibody

-based tests were developed for the organophosphorus pesticides,

fenitrothion and pirimiphos-Me. To complement the rapid anal., rapid but efficient extn. techniques were developed. In these tests, a pesticide-contg. methanol ext. of the grain sample and an enzyme-labeled component are added dropwise to precoated tubes contg. buffer. After a brief incubation, the tubes are rinsed out in tap water and a substrate/chromogen for the enzyme is added. The color developed is stabilized by acidification and the test result read either by eye or in a portable field photometer. Significant levels of the particular pesticide result in a pale color compared to a dark green pesticide-free control. No calcns, were required to provide a quant, est, of residue as this could be read directly from a graph of color yield (absorbance) vs logarithm of pesticide concn., using std. solns. of pesticide. For fenitrothion, the test had a limit of detection of 4 ng/mL (0.1 ppm in grain) and gave quant. ests. in the range 0.5-15 ppm (in the grain), while the pirimiphos-Me test had a limit of detection of 1 ng/mL (0.03 ppm in grain) and gave quant. ests. over the range 0.1-15 ppm. Thus both tests can be used to segregate "pesticide-free" grain, with residues below 0.1 ppm. Data obtained using the field test correlated well with those obtained using lab. methods, including both gas-liq. chromatog. and immunoassay using microwell plates. The field immunoassay reagents were formatted into a small prototype test kit, and the components stabilized for field use.

An enzyme immunoassay was developed for the synthetic pyrethroid, bioresmethrin, by use of a novel approach for synthesis of the pyrethroid-protein hapten conjugate for antibody prepn. Bioresmethrin was hydrolyzed at the ester linkage, and following protection-of-the-chrysanthemic-acid-group,-the-2-methylprop-1-ene substituent was oxidatively cleaved. The newly formed and unprotected acid group was reesterified to the other bioresmethrin hydrolysis product [[2-(phenylmethyl)-4-furyl]-methanol], and following substitution of the protecting group, the hapten was coupled to either protein for antibody prodn. or peroxidase for use in the immunoassay. The most sensitive assay employed an antibody prepd. to a deriv. with a 4-carbon spacer arm between bioresmethrin and carrier protein, but used a bioresmethrin-enzyme reporter prepd. using a 4-

(aminomethyl)cyclohexane-carboxylic acid spacer arm (limit of detection 2 ppb in buffer, 50 ppb in whole wheat or barley grain). Good correlations between HPLC and ELISA detns. of bioresmethrin in whole or ground barley grain were obtained. The sensitivity of the assay was slightly lower in ground grain or flour milling fractions due to interference from coextractives in methanol exts. Apart from resmethrin, of which bioresmethrin is the 1R,3R-trans-isomer, the assay did not detect a variety of other pyrethroids in com. use.

An antibody-based method for discrimination of wheat flours or whole meals on the basis of differences in dough strength (Skerritt 1991b), as measured by extensigraph max. resistance for example, was simplified for use in large-scale screening to predict dough quality. major modification was the addn. of unlabeled antibody to the dild. grain ext. being analyzed, which simplified sample handling. It reduced the dilm. of the grain exts, being tested and improved the differentiation between flours of different strengths. method was also developed for simultaneous extn. and testing of sets of 96 unweighed whole meal samples. The method was tested in a collaboration trial in eight labs. (none with significant prior immunoassay experience) using two sep. analyses of a set of 16 flours, including three blind duplicates. Each lab. reported highly significant correlations between color developed in the assay and rheol. measurements of dough strength, such as farinograph development time and extensigraph max. resistance. Good ests. of within- and between-lab. precision were also obtained, indicating that the method was suitable for quality assessment in wheat breeding.

Three different chem. approaches were used to couple the organophosphorus pesticide fenitrothion to carrier proteins for prodn. of polyclonal and monoclonal antibodies. Hapten conjugates coupled through the pesticide phosphate group yielded the most specific and highest affinity antibodies, although antibodies of moderate affinity were obtained by derivatization and coupling through the arom. nitro group following its redn. and amide formation with an adipic acid spacer arm. Assay formats using either immobilized antibody or immobilized hapten-protein conjugate could be used to det. free fenitrothion. The most sensitive assay could detect 1 ng of fenitrothion. It is recommended for the detection of residues of fenitrothion used for the protection of stored cereals.

Simple, competitive enzyme-linked immunosorbent assays (ELISAs) were developed for the quantitation of each of 3 major organophosphate insecticides: fenitrothion (FN), chlorpyrifos-Me (CPM), and pirimiphos-Me (PIRM). The performance of these assays on wheat **grain** and (for FN and CPM) on milling fractions such as flour, wheat germ, and bran was assessed. Each assay was specific for the particular compd., i.e., no significant cross-reaction with the other 2 pesticides was obsd. limited reactions were noted with major metabolites or analogs of these pesticides. Assay limits of detection of 0.3 ng FN, 0.2 ng CPM, and 0.02 ng PIRM were recorded, corresponding to limits of detection in whole grain of 0.08 ppm FN, 0.2 ppm CPM, and 0.03 ppm PIRM. Each compd. in grain and milling fractions could be extd. quant. by shaking in MeOH. Multiresidue anal. of the 3 insecticides was performed by simultaneously adding the cereal ext. (dild. in phosphate buffer) to sep. duplicate microwells coated with antibodies to FN, CPM, and PIRM and adding appropriate pesticide-horseradish peroxidase conjugates. High correlations between gas chromatog. and the ELISA methods were obtained for insecticide levels in whole wheat and in milling fractions. The ELISA assays had precision similar to those of instrumental pesticide analyses.

The humoral and cellular immune responses to grain protein exts. from celiac-toxic and non-toxic cereals were compared by use of a no. of ELISA and immunoblotting methods and the indirect leukocyte migration inhibition factor (LMIF) assay. Both adult and child celiacs had elevated levels of serum antibody to proteins from the celiac-toxic cereals, namely bread wheat, durum wheat, rye and barley and low levels of proteins from other cereals. Using protein-blotting techniques, antibody binding was greatest to gliadins/low-mol.-mass glutenin subunits and homologous prolamins from rye and barley, consistent with the ELISA findings. Competition ELISA and preabsorption tests indicated that antibody reaction to maize storage proteins did not simply result from cross-reaction of antigliadin antibodies. In LMIF assays, only the wheat exts. had activity in celiac patients. This is most likely partly due to loss of some T-cell epitopes from the extn. technique required for these proteins, as well as the relatively small effects seen for even very active fractions in the LMIF assay.

Antisera against seven different wheat (Triticum aestivum) storage protein subfractions were characterized using (1) ELISA with gliadins and low- and high-mol. wt. glutenin subunits and (2) electrophoresis (SDS-PAGE and acidic buffer PACE) and immunoblotting. The specificities of these antisera (polyclonal antibodies) and 13 monoclonal antibodies covered various patterns of reactivity with alphabeta-, gamma- and omega-gliadins and low- and high-mol. wt. glutenins. The antisera and antibodies were applied to ultrathin sections of wheat endosperm tissue, from kernels fixed 30 days after anthesis, and were detected by secondary **antibodies** tagged with either 5 or 15 nm gold particles using transmission electron microscopy. Labeling was denser when the small gold particles were used but irresp. of gold particle size, labeling of polyclonal antisera predominated when the endosperm cells were subjected to both mono- and polyclonal antibodies. Each of the antisera and monoclonal antibodies that labeled the protein bodies, labeled them more or This indicates that only one kind of protein body, contg. less uniformly. all gliadin and glutenin subfractions, exists during this stage of grain development. Electron-dense globular inclusions found in many protein bodies were not labeled. Label was also found on protein-like material present in the lumen of the rough endoplasmic reticulum and on vesicles of the Golgi app. Thus, concn. of storage proteins takes place both at the site of synthesis, the lumen of the rough endoplasmic reticulum, and at the site of processing and transport, the vesicles of the Golgi app. Fusions between these proteinaceous materials give rise to larger protein bodies and ultimately to the protein matrix.

The genetic relationships between small clusters of monomeric alc.-sol. wheat (Triticum aestivum L.) grain storage proteins (gliadins) were studied using a panel of monoclonal antibodies and immunoblotting, ELISA, and RIA methods. Use of Chinese Spring nullisomic-tetrasomic lines showed that several narrow-specificity antibodies bound specifically to gliadins encoded by genes located on a single chromosome. In at least one case, antibodies bound to genetic blocks of gliadins, indicating that these block members have structural homol. However, often not all gliadins of a block were recognized by an antibody. For broad-specificity antibodies and some narrow-specificity antibodies structural genes on several chromosomes were important. Studies with several primitive wheat species indicated that, while antibodies usually bound gliadins from the same genome in bread and primitive wheats, antibodies sometimes bound proteins of quite differing mobilities in the two wheat types. Use of antibodies to identify gliadin blocks is simpler than block anal. based on performing crosses, and should be of value in monitoring genotype/end-use quality relationships.

The enzyme immunoassay of J. V. Mei, et al. (1990) was improved for the insect growth regulator methoprene, and the assay was used to det. methoprene in whole wheat grain and milling fractions, including flours, whole meal, bran, and wheat germ. Either MeOH or MeCN could be used to ext. methoprene from grain, flours, and bran; no cleanup of exts. was required. MeOH produced less matrix effects and could be tolerated at higher concns. in the assay. MeCN gave more reliable results in the extn. of methoprene from wheat germ. The improved assay had a sensitivity of 250 pg/mL, and 50% inhibition of antibody binding

NGUYEN 09/830,876

occurred at 3 ng/mL, corresponding to a max. sensitivity of 60 ppb and 50% inhibition of antibody binding at 0.75 ppm in the wheat sample when the routine assay method was used. The latter value is in keeping with residue levels typically found in methoprene-treated stored grain. Good correlations were found between methoprene detd. in wheat and grain fractions by the enzyme immunoassay and by conventional HPLC anal.

Organophosphates, synthetic pyrethroids and/or carbaryl are applied to stored grain and grain storage facilities to minimize insect infestation. Local industry deregulation coupled with increasingly stringent export residue tolerances and consumer demand for chem.-free foods have markedly increased demand for pesticide residue testing. Monoclonal and polyclonal antibodies have been prepd. and test methods developed for fenitrothion, the major organophosphate pesticide used on grain. Some antibodies were specific for fenitrothion and sensitive to 0.1-0.5 ng; other antibodies bound to closely related organophosphates as well. A simple cholinesterase inhibition test for general screening for organophosphates and carbamates is being adapted for use in field situations or high-throughput labs. Antibodies to certain pyrethroids (phenothrin, permethrin) are being assessed for use in simple test kits.

A sensitive competition enzyme-immunoassay for quantification of gluten in foods was developed, using horseradish peroxidase-labeled monoclonal antibodies. Selected antibodies specific for wheat .omega.-gliadin components were used, and these antibodies bound proteins from the related cereals, rye and barley, which are also toxic to individuals with gluten-intolerance (coeliac disease). Binding of these antibodies was not inhibited by heating of gluten during cooking or baking and the assay did not detect cereals not toxic in coeliac disease, such as maize or rice.
Gluten could be quantified at higher levels in meat products or in cereal products such as flours or baked goods. Results were not affected by wheat variety. Quant. results could be obtained using simple extn. techniques and solvents (40% or 70% ethanol). Detection of gluten was quant. in a wide range of foods, except for certain products contg. gluten proteins that had been subjected to severe heat, enzymic, or chem. treatment. In these products overestimates rather than underestimates were usually obtained.

A collaborative study was performed in 15 labs. to validate a monoclonal antibody-based enzyme immunoassay (EIA) for detn. of gluten in foods. The study included 13 samples: corn starch, gluten-free baking mixes, wheat flours, cookies, cooked meats, and a soup. Gluten was present in these samples at either zero or 0.02 to 10% by wt., i.e., over almost 3 orders of magnitude. The mean assay values for the foods varied from 88 to 105% of the actual amts. The assay was quant. for cereal products and the soup with repeatability (RSDr, relative std. deviation) and reproducibility (RSDR) of 16-22% and 24-33%, resp.
The assay was semiquant. for the processed meat products (RSDr 14 and 26% and RSDR 46 and 56%), probably because gluten was unevenly distributed in the small (1 g) samples that were analyzed. The ELISA method produced no false pos. results, and false negatives obtained with tannin-contg. foods could be avoided by use of a modified sample extractant. None of the collaborators reported problems in following the protocol. The method has been adopted official first action by AOAC for detn. of wheat gluten in

DOCUMENT TYPE: LANGUAGE:

Structural homologies between wheat (Triticum aestivum) gluten proteins and proteins present in well-washed starch granules were examd. with a panel of mouse monoclonal and mouse and rabbit polyclonal antibodies, using immunoblotting, ELISA, and immunocytochem. methods. Many antibodies raised against gluten protein fractions cross-reacted with starch granule proteins (SGP), but often

NGUYEN 09/830,876

weakly. Antibodies with similar gliadin and glutenin subunit specificities had similar SGP specificities. Antibodies to high-mobility (.alpha.-, .beta.-, .gamma.-) gliadins cross-reacted weakly with low-mol.-wt. SGP (Mr 8000, 19,000 and 30,000) on immunoblots, and very weakly in indirect ELISAs. Some of these antibodies labeled both protein bodies and the periphery of starch granules in sections of immature grain, consistent with low-mol.-wt. SGP deemed to be surface SGP on the basis of extractability studies, indeed being present on the granule surface. Monoclonal antibodies that bound .gamma.- or .omega.-gliadins and glutenin subunits bound to higher mol. wt. SGP, esp. a protein of Mr 77,000, at concns. only slightly above those which labeled gluten proteins. As the interior of the starch granule section was labeled, these proteins are likely to be integral to the granule. Antibodies binding broadly to all major gluten protein classes also bound most high and low-mol.-wt. SGPs. Some starch proteins of Mr 15,000, which have been assocd. with endosperm softness, appeared to be immunol, distinct.

DOCUMENT TYPE: LANGUAGE:

The immunol. homol. of low-mol. wt. glutenin subunits (LMW-GS) were compared with the other major wheat gluten polypeptides, high-mol.-wt. glutenin subunits (HMW-GS), and gliadins. Conventional 1-dimensional polyacrylamide gel electrophoretic (PAGE) methods were used as well as a 2-step, 1-dimensional sodium dodecyl sulfate-page technique, together with immunoblotting and enzyme-immunoassay methods. Many antibodies raised to gliadins and HMW-GS bound well to LMW-GS. Antibodies with specificities for similar groups of gliadins bound to similar groups of glutenins; and HMW-GS but not to other grain proteins, suggesting the existence of "common gluten" amino acid sequences or conformations. The soly. and immunochem. similarities as well as the known linkage between the genes for LMW-GS and certain gliadins mean that

LMW-GS may be responsible for many biochem. properties and quality effects usually attributed to gliadins.

DOCUMENT TYPE:

LANGUAGE: English

A variety of monoclonal antibodies with specificities for different wheat grain storage proteins has been shown to exhibit a no. of differing cross-reaction patterns with grain storage proteins from related cereal species (Skerett and Lew, 1990). This antibody library provides an opportunity to measure the effects of a range of immunoassay methodol. variables on the cross-reactivity of these antibodies. Variation of the extractant used for grain proteins from different cereals altered both the amt. and compn. of protein extd. and thus the cross-reaction of the antibodies. Antibody cross-reactivity was greater when nitrocellulose membrane solid phases compared with polystyrene microwells were used for indirect ELISA. Quite differing cross-reactivity results were obtained when the same grain protein exts. were used in indirect, antigen-competition and sandwich-type assay formats. In the sandwich assay format, alteration of either the solid phase-bound or labeled antibody altered apparent antibody specificity. Thus, it is important when reporting immunol. homol. data, to define cross-reaction of antibodies with respect to the assay format used. Antibody specificity (or cross-reactivity) can be manipulated by variation of sample extractant, solid phase and the format of the assay.

LANGUAGE:

The interactions of a library of monoclonal antibodies, prepd. to wheat (Triticum aestivus L.) gluten proteins, with exts. of total seed storage protein from a no. of related cereals was studied qual. using SDS-PAGE and immunoblotting techniques and studied quant. using indirect enzyme-immunoassay. Antibodies were of four cross-reaction types: (1) some antibodies, such as many of those binding .alpha.- and .beta.-gliadins, bound selectively to wheat grain proteins, (2) others with similar gliadin specificities, bound to prolamins from other Festucoid species (rye, barley and oats),

(3) other antibodies specific for certain .gamma.- and omega.-gliadins and high-mol.-wt. glutenins, bound very well to proteins from wheat, rye and barley grain, while (4) some antibodies showed anomalous cross-reactivities, binding well to wheat and maize prolamins but very weakly to rye or barley grain proteins. These homologies were generally in keeping with structural homologies of proteins from various cereal grains obtained from DNA sequencing and cross-hybridization studies. In some cases, new homologies were identified.

LANGUAGE:

English The influence of diet on humoral immune responses to gluten- and corn-derived proteins was examd. by ELISA and protein blotting techniques. Mice raised on the corn-based (gluten-free) diet responded well to parenteral immunization with each of 6 gluten-derived protein prepns. (whole gliadin, 2 omega-gliadin fractions, wheat salt-sol. proteins, a peptic-tryptic digest, and a subtilisin digest of gluten); serum antibody levels increased at least 300-fold in each case. In contrast, mice raised on the wheat-based diet responded poorly to immunization with either whole gliadin or omega-gliadin and were virtually nonresponsive to enzymic digest of gluten. Diet had little effect on the magnitude of the **antibody** response to wheat salt-sol. proteins, with both groups showing a 300-fold increase in titer. Similarly tolerance to .alpha.-zeins, the alc.-sol. proteins of corn did not occur on either diet. Some oral tolerance was obsd. to corn glutelin. specificity of the various antibody responses was then analyzed by immunoblotting. Following immunization with gluten proteins or digests, antibodies from the corn-fed mice bound more or less equally to each of the main gliadin bands and to the glutenins, whereas the mice on the wheat-based diet had antibody specific for omega-gliadin proteins. Serum antibodies from the corn-fed mice, immunized with either .alpha.-zein or corn glutelin, showed even labeling of the major corn endosperm proteins whereas antibodies from mice on the wheat diet showed strong labeling of the mol. wt. 27,000 and 58,000 bands. Diet influenced the specificity, as well as the magnitude, of serum antibody responses to cereal proteins. In addn., oral tolerance appeared to affect the humoral response to some cereal proteins more than others. Both of these findings have important implications for the understanding of celiac disease.

English LANGUAGE:

A wheat cDNA library, prepd. from grain endosperm poly A+ mRNA and cloned into the Escherichia coli expression vector lambda gt11, has been screened with 9 monoclonal antibodies having specificities for different wheat endosperm proteins. At least 1 pos. cDNA clone was isolated and purified from those selected with each antibody. Each purified cDNA clone was induced to express fusion proteins, and the nitrocellulose membranes to which the proteins were transferred were incubated with each of the other antibodies at .gtoreq.2 concns. to investigate the extent of homologies between expression fusion proteins. The specificities of the antibodies were detd. using immunoblotting under the same conditions used for binding to the fusion proteins from the expressed cDNA clones. Denatured DNA from each antibody-selected cDNA clone was also characterized by hybridization to .alpha.-/.beta.-genomic gliadin and genomic high-mol.-wt. glutenin subunit DNA probes. Northern hybridizations using the isolated cDNA as probes for endosperm mRNA were also used to assist clone identification. Some monoclonal antibodies with overlapping specificities (identified from blotting and ELISA expts.) crossreacted with several expressed cDNA clones. However, in other instances, pos. identifications were made of the proteins coded for by single families of the cDNA clones. Monoclonal **antibody** screening of a wheat cDNA library is useful in identifying families of cDNA clones corresponding to different wheat polypeptides at the primary screening stage, obviating the need in many instances for the application of more tedious methods of clone identification.

Modern protein anal. methods, including size-exclusion and reversed-phase HPLC, PAGE, and monoclonal antibody tests were used to examine protein modification in grain during malting and in mash exts. and wort in brewing. Size-exclusion HPLC and electrophoresis are useful for providing qual. anal. of malt modification and proteolysis and protein pptn. during mashing; hydrolysis of specific proteins can also be quantified by HPLC or by immunoassay. Other antibody tests to measure residual protein from malt and cereal adjuncts in finished beers and to det. whether proteolytic enzymes were used in chillproofing of beers are also described.

Enalish I ANGUAGE: A panel of monoclonal antibodies with various specificities for wheat (Triticum aestivum) gluten polypeptides has been used to analyze the accumulation of these polypeptides in the endosperm of developing wheat seeds grown under normal and S-deficient conditions. Immunoblots of polypeptides fractionated by SDS-PAGE allowed a qual. anal. of gliadin and high-mol.-wt. (HMW) glutenin accumulation for high- and low-S seeds 8-30 days after anthesis (d.a.a.). In addn., quant. anal. of the deposition of various gluten polypeptides was performed, with a solid-phase RIA on exts. of seeds harvested 4-36 d.a.a. The initial accumulation of HMW glutenin subunits was detectable at an earlier stage of development than that of gliadins for both normal and S-deficient seeds. The initiation of detectable gliadin accumulation was asynchronous with an order of .alpha.-gliadins, .beta.-, .gamma.- and some .omega.-gliadins and finally the remaining .omega.-gliadins. In S deficiency, all gliadins reached a const. proportion of the dry wt. of the endosperm earlier than in normal wheat, while a more marked increase in the proportion of HMW glutenin occurred late in grain development. The protein blot studies also identified a putative .omega.-gliadin polypeptide which was detectable late in seed development and only in S-deficient seeds.

Proteins correlation with end-use quality in wheat (Triticum aestivum L.) flour samples have been quantitated using a panel of monoclonal. antibodies (MCA) with specificities for different gliadins (grain endosperm storage proteins which are sol. in aq. alc.). beta-gliadin specific antibody was found suitable for measuring sulfur-related quality loss in sets of flours from three wheat cultivars grown under varying conditions of sulfur fertilization. Binding of this monoclonal antibody, measured in a competitive enzyme-immunoassay, was highly correlated with flour sulfur and with the extensibility of, and resistance to stretching of doughs prepd. from these flour samples. These results demonstrate that monoclonal antibodies may be used to measure levels of specific components which vary as the technol. quality of the food varies. Rapid spot-tests based on the reaction of seed proteins with specific monoclonal antibodies may aid progeny selection in plant breeding program.

      A variety of monoclonal antibodies was prepd. to wheat (Triticum
      aestivum) gluten proteins, and their antigenic specificities were assessed
      using non-denaturing polyacrylamide gradient and SDS-PAGE and
      immunoblotting techniques. While most anti-gliadin monoclonal
      antibodies bound to all gliadin protein bands sepd. by
      1-dimensional electrophoresis, several antibodies binding to
      small groups of gliadin proteins were identified. At high concns., these
      specific antibodies bound to an increasing no. of gliadins; this
      is likely due to the very high sequence homologies between groups of
      gliadin proteins. Several monoclonal antibodies with specificities for glutenin proteins were produced. These
      antibodies bound to all major glutenin subunits, although at low
      antibody concns. some bound selectively to a single subunit.
      Other anti-glutenin antibodies bound to minor glutenin subunits
      and a variety of gliadin proteins. Several bound to .gamma.-gliadins and
      high-mol.-wt. glutenins, suggesting that these groups of proteins bear
      considerable homol. The results are reviewed in relation to known
      information on gluten protein structure, derived from DNA-sequencing
       studies.

       Three new approaches, which rely on differences in hordein compn. or
```

properties, were investigated for their suitability as barley variety identification methods, to supplement visual and electrophoretic methods. High-performance liq. chromatog. on either ion-exchange or reversed-phase columns can differentiate barley varieties that cannot be distinguished by electrophoresis. Differences in the interaction of hordeins from various varieties with a set of monoclonal antibodies may form the basis for rapid spot-test for confirmation of variety or quality type. In addn., a very simple test based upon differences in the turbidity of grain exts. will be of use in preliminary screening of barley samples. There is potential for these new methods to be applied to malt anal.: both varietal identification of malts and detn. of the extent of (protein) modification. Components yielding processing problems can be identified and quantitated in malt samples.

Comparisons of buckwheat and wheat proteins according to amino acid compn., electrophoresis, and immunol. reaction revealed little or no similarities. Whereas most of the material extd. from wheat flour by 70% EtOH (following salt extn.) was protein in nature, similar exts. from buckwheat contained only 2.4% N. Unlike wheat gliadin, the corresponding buckwheat fraction was rich in lysine, arginine, and glycine; it was not electrophoretically resolvable into gliadinlike bands on lactate-buffered polyacrylamide gels, and on SDS polyacrylamide gels; it had only minor components in the gliadin mol. size range. Immunol. studies with rabbit polyclonal and mouse monoclonal antibodies showed little cross-reactivity between cereal prolamins and buckwheat proteins. Celiac sera with high IgG anti-gliadin titers also reacted very weakly with buckwheat proteins. These results suggest that alc.-sol. buckwheat proteins (which are only minor components of the endosperm) bear little mol. similarity to wheat prolamins; descriptions of the former as glutenlike are misleading.

Of a series of monoclonal antibodies prepd. to cereal proteins, 2 antibodies with specificity for low-mobility, heat-stable prolamins in wheat and related cereals were investigated as possible probes for a test for gluten in cooked or processed foods. Urea-based solvents were superior to iso-PrOH or SDS extractants in allowing sensitive detection of trace amts. of prolamins. The antibodies detected bread and durum wheat and rye prolamins most strongly, followed by barley then oats; detection of corn and rice was quite weak. This selectivity is suitable for a test for prolamins toxic to coeliac-disease patients. Several enzyme-labeled 2nd

antibodies, for detection of monoclonal antibody bound to cereal protein, were unsuitable reagents since an appreciable fraction of the 2nd antibodies bound directly to the cereal proteins. Sensitive, artifact-free detection of antibody binding could be performed using the peroxidaseantiperoxidase technique or by direct conjugation of horseradish peroxidase to the monoclonal antibodies.

An enzyme-coupled monoclonal antibody has been used to quantify gliadin-like immunoreactivity in a variety of foods. Small discs of nitrocellulose are soaked in food ext. or a series of std. gliadin solns., and incubated with antibody and an enzyme substrate yielding a sol. product. By use of a photometer, std. curves for gliadin may be constructed and the apparent gliadin content of samples calcd. The reproducibility of the procedure was examd. using a variety of common foods and food proteins. The limit of detection for wheat gliadin was .apprx.20 .mu.g/mL ext.; gliadin levels in excess of this value were found in some gluten-free bread mixes and starch [9005-25-8] sources. The overall time for anal. is 5-6 h, although for large nos. of samples, overnight blocking of non-specific antibody binding may be used. It is possible that a library of enzyme-linked monoclonal antibodies could be developed as useful tools for specific food anal.

A method for detection of wheat, rye, barley and oat proteins in a wide range of foods, including baked goods and processed meats has been developed. The procedure requires immobilization of food exts. on nitrocellulose paper followed by treatment with an enzyme-conjugated monoclonal antibody. Upon addn. of the appropriate enzyme substrate, gluten-contg. foods yield purple spots; a wide range of non-gluten common food proteins did not react. The method has several advantages over other means of detecting cereal protein, such as electrophoresis. It is rapid, requiring little sample prepn., and does not require sophisticated equipment or prior knowledge of electrophoretic patterns of common non-cereal food proteins. Since the method may be used with cooked or baked foods, it should be suitable for food-monitoring applications.

A simple test for the presence and level of cereal gluten proteins in foods has been developed using monoclonal antibodies with specificity for heat-stable proteins from wheat, rye, barley, and oat grain. The test is faster, more sensitive and more reliable than other methods, such as electrophoresis, and may be applied to both cooked or processed as well as raw foods. The ability of monoclonal antibodies to act as sensitive reagents having reproducible specificities should allow their use in a wide range of immunochem. methods in food anal.

Monoclonal antibodies were prepd. to a gliadin protein ext. of bread wheat (Triticum aestivum cv Timgalen) and specific antibody -cereal protein interactions were detected using horseradish peroxidase-coupled second antibodies after transfer of proteins to nitrocellulose following electrophoresis. Whereas some antibodies had broad specificity for gliadin protein, other antibodies of narrower specificity were investigated further. latter antibodies were selective for .omega.-gliadins and bound neither high-mol.-wt. glutenin subunits albumin and globulin wheat proteins, nor a wide variety of other proteins. However, certain related cereal species such as durum wheat, barley, and rye contained endosperm proteins recognized by these monoclonal antibodies. This observation confirms that sequence homologies exist between prolamins from wheat and related cereal species as well as between certain gliadins from hexaploid wheat.

WO 1999-AU995

A two-site immunoassay for the qual. or quant. detection of .alpha.-amylase in a test sample comprises: (i) exposing the test sample to a first ("capture") antibody or antibody fragment which specifically or preferentially binds to a first epitope on the .alpha.-amylase under conditions permitting binding; (ii) subsequently exposing bound .alpha.-amylase to a second ("detection") antibody or antibody fragment which specifically or preferentially binds to a second epitope on the .alpha.-amylase that is distinct from the first epitope, under conditions permitting binding of the second antibody or its fragment to the bound .alpha.-amylase; and (iii) detecting any binding of the second antibody or its fragment to the bound .alpha.-amylase, wherein either of the first or second epitopes is an epitope comprising one or more of the amino acid sequences: IDRLVSIRTRGQIHS, CRDDRPYADG, or VNWVNKVGGS and variants thereof showing .gtoreq.80% (preferably .gtoreq.90%) sequence identity. The immunoassay is useful for detecting weather damage (i.e., preharvest sprouting) in cereal grain. Thus, a rapid tube sandwich ELISA detected .alpha.-amylase in preharvest-sprouted wheat exts. at .apprx.4 ng/mL.

The present sequence represents an epitope from the wheat alpha-amylase Antibodies which recognise the epitope are used in a two-site immunoassay for qualitative or quantitative detection of alpha-amylase in a test sample. The assay is used for detecting weather damage in a cereal grain. Weather damage is caused by the action of hydrolytic
                       enzymes, e.g. amylases, in the grain endosperm. These enzymes accelerate the breakdown of starch granules and protein in the endosperm of germinating grain. Individual growers can identify areas of sprouting prior to harvest, preventing contamination of sound wheat by weather damaged wheat. The damaged grain can be harvested separately from the sound grain and financial losses resulting from down grading the whole crop can be avoided. The two-site immunoassays can be applied at mill or silo (elevator) receival of grain or can be used on farms with minima
                                                                                                                                                                                                                                                  Two site immunoassay for the qualitative or quantitative detection of alpha-amylase in a test sample, used to detect weather damage in a cereal grain, such as wheat, rye, triticale or bariey -
                                                                                                                                                                                                                                                                                                                                         Skerritt JH;

                                                                                                                                      The present sequence represents a wheat alpha-amylase. Antibodies which recognise epitopes from this protein are used in a two-site immunoassay for qualitative or quantitative detection of alpha-amylase in a test sample. The assay is used for detecting weather damage in a cereal grain. Weather damage is caused by the action of hydrolytic enzymes, e.g. amylases, in the grain endosperm. These enzymes accelerate the breakdown of starch granules and protein in the endosperm of germinating grain. Individual growers can identify areas of sprouting prior to harvest, preventing contamination of sound wheat by weather damaged wheat. The damaged grain can be harvested separately from the sound grain and financial losses resulting from down grading the whole or silo (elevator) receival of grain or can be used on farms with minimal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a gene expression system containing the promoter region of an alpha-smylase gene. Also described is a method for preparing a transgenic rice plant comprising: (1) infecting Agrobacterium into an unmatured embryo of a rice plant; (2) simultaneously culturing the embryo with a suspended culture of a diootyledon during the transforming step; (3) growing the transformed embryo to a callus in a selective medium containing a plant growth hormone; and (4) regenerating the callus to roots and sprouts in a regeneration medium. The method can be used for mass production of a desired gene product in a plant host cell. The present sequence represents the rice alpha-Amy7-C protein, which is used in an example from the present invention.

The present sequence is that of rice (Oryza sativa) cv. M202
alpha-amylase, encoded by isolated genomic DNA clone alpha-Amy7-C
(see AA170537). Expression of alpha-Amy7-C in cultured suspension
cells of rice was induced 6-fold at day 12 after sugar depletion,
and continued to increase up to day 14. The invention relates to
the use of an alpha-amylase gene promoter and signal sequence in
the production of recombinant proteins in transgenic plants and
transgenic plant seeds. In a claimed method, a transgenic monocot
is obtained by: transforming an immature embryo of the plant via
Agrobacterium-mediated transformation with DNA comprising a plant
calpha-amylase promoter (e.g. the rice alpha-Amy7-C promoter) that
is induced under sugar-depleted or sugar-free conditions, a signal
peptide sequence, and an exogenous sequence encoding a gene product;
plant, which expresses the gene product under sugar-depleted or
sugar-free conditions. The gene product may also be obtained by
cultivating an anglosperm host cell. The transgenic monocot plants
are especially useful in brewing and to produce glucose from starch.

DNA encoding the signal peptide of alpha-amylase and the promoter along with the glucuronidase reporter gene and hygromycin resistance gene are used in the construction of a GUS gene expression vector, which when transformed into rice suspension-cultured cells, can be used to investigate the expression of the vector under the control of the promoter. The gene expression system can be used to conduct gene regulation and protein expression and secretion using the characteristics of the alpha-amylase gene promoter and the DNA sequence encoding the signal peptide. The present sequence represents an alpha-amylase related protein used in the course of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gene expression system comprising the promoter region of alpha-amylase gene, produces large quantities of alpha-amylase in culture medium of sugar starved rice - \,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAR76519-R76521 represent the amylase gene products alpha-amylase-6-C, alpha-amylase-7-C and alpha-amylase-8-C respectively. The promoter regions of these amylase genes are used in a new gene expression system the system may be used for the expression of heterologous genes in plantage and for the large scale production of the encoded products of succession and for the large scale production of the encoded products of successions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gene expression system contg. alpha-amylase gene promoter in plants for expression of heterologous genes

Other genes which may be inserted into the virus are those which control a phenotypic trait, such as male sterility, or sequences encoding anti-sense RNA which can be useful to prevent the expression of undesired phenotypic traits. The recombinant virus is derived from a plus sense, single stranded virus selected from tobamovirus, brome mosic virus, rice necrosis virus or a gemini virus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence is rice alpha amylase. The coding sequence was inserted into a recombinant plant viral nucleic acid which was then used to express a recombinant product (in this case rice alpha-amylase) in a plant. The plant viral sequence may be from tobacco mosaic, cucumber green mottle, cowpea mosaic, brome mosaic, broad bean mottle, rice necrosis, geniniviruses, tomato golden mosaic, Cassava latent and maize streak viruses.
A DNA sequence (AAT47095) codes for rice alpha-amylase (AAW10469) novel viral nucleic acids can be constructed in which the alpha-amylase coding sequence is placed under control of the promoter of the tobacco mosaic virus coat protein gene, which has been deleted. The recombinant viral nucleic acid is capable of self-
                                                                                                                                                                                                                                Recombinant viral nucleic acid producing, e.g. male sterility in plants - comprises nucleic acid whose transcription is controlled
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Recombinant plant viral nucleic acids - e.g. antibody or IL-1 in a plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 1993-076518/09

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant virus; alpha-haemoglobin; human; chinese cucumber; alpha-trichosanthin; rice; alpha amylase; beta-haemoglobin; subgenomic promoter; coat protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                   subgenomic promoter, and a sequence encoding a plant virus coat protein. These heterologous sequences are preferably under the control of the native promoter sequence. By using a plant virus
                                                                                            The sequences given in AAW11868-71 represent proteins which were produced by the recombinant viruses of the invention. The viruses are recombinant plant viruses which comprise a native plant virus subgenomic promoter, at least one non-native plant virus
                                                                                                                                                                                                                                                               protein
                                                                                                                                                                                                                                                                                Recombinant viral DNA for altering plant phenotype or protein prodn - contains non-native sub-genomic promoter for expression of heterologous protein and native promoter for expression of coat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       26-JUL-1991;

The recombinant viruses are stable and can cause systemic infection, with stable expression/transcription in plants that are hosts for the non-native part of the vector. The nucleotide sequences encoding these protein preferably integrated in plant viruses having either the O-coat protein or the U1-coat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                operably joined to a first nucleic acid expression sequence; and (b) a second plant viral subgenomic promoter that is non-native and is operably joined to a second nucleic acid expression sequence; where, (i) (a) and (b) are incapable of recombination with one another, (ii) either the first or the second nucleic acid expression sequence is a plant viral coat protein coding sequence. The recombinant plant viral nucleic acid allows the transcription of products in a host, such as therapeutic and other useful polypeptides or proteins e.g. enzymes, complex biomolecules and ribozymes. It also gives the option of applying the coding sequence to the desired organism, tissue, organ or ceil, is stable for the foreign coding sequences and is capable of systemic infection in the plant host. The transformation and regeneration of target organisms become
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Oryza sativa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rice; alpha-amylase;

The nucleic acid sequence can be expressed in the plant viral constructs of the invention. The specification describes a recombinant plant viral nucleic acid derived from a positive (+)-sense RNA plant virus comprisin a native (+)-sense RNA plant virus promoter that is linked to an expression sequence and a heterologous (+)-sense RNA plant virus promoter that is linked to an expression sequence. The promoters are incapable of recombination with each other, and one of the expression sequences encodes a plant viral coat protein while the other is optionally a heterologous coding sequence. The plant viral nucleic acid is capable of systemic infection in a host plant. The viral construct is useful for the introduction and expression of non-viral foreign genes in plants and the production of e.g. potential AIDS therapeutic drugs.
                                                                                                                                                                                                                                                                                                          26-JUL-1991;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Qy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    CC This invention describes a novel recombinant viral nucleic acid (I) CC from a non-retroviral (+) sense, single stranded animal RNA virus CC comprising a nucleic acid sequence coding for a viral coat protein CC regulated by a native subgenomic promoter and other two heterologous CC nucleic acid sequences regulated by two other subgenomic promoters. CC (I) is useful for expressing foreign genes e.g. genes inducing male CC sterility in plants. (I) is also useful for producing proteins such as CC interleukins, EPO (erythropoletin), CSF (colony stimulating factor), CCF Factor VIII, hGH (human growth hormone), melanin, insulin, vaccines CC etc., and enzymes that are useful for stereo specific catalysis of. CO organic compounds. (I) is stable and transcribed systemically. The dual CC subgenomic promoter system reduces the frequency of recombination thus creducing regeneration of the wild type virus. This sequence represents CC incentical promoter system reduces the frequency of recombination thus considered a plan-amylase protein which is described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match

frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used
                                                                                                                                                        AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae.
                                                                                                                                                                                                                                                    Page 1288-1289; Disclosure;

Q
                                                                                The invention relates to novel human secreted polypeptides. The CC polypeptides and antibodies to the polypeptides are useful for determining the presence of or predisposition to a disease associated converted to the polypeptide. The polypeptides are also useful for converted to the polypeptide and to them. Cells converted to the proteins are useful for identifying a therapeutic agent converted to a pathology related to aberrant expression or converted to the protein converted to the protein converted to the nucleic acids encoding the polypeptide. Vectors comprising converted to express them are also useful for producing the proteins. The proteins are useful in genetic vaccination, testing and the proteins are useful proliferation; to regulate haematopoiesis; and in the converted to the protein and can be used as nutritional supplements. They may be used to converted the protein and proliferation; to regulate haematopoiesis; and in the cartilage, tendon and/or nerve tissue growth or regeneration; to converted to the protein and proliferation; as anti-inflammatory agents; and converted to the protein and proverted to the prov
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has CC vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and CC antidabetic activity and acts as an angiogenesis and vascularization and the invention is useful for treating CC regulator. An antisense molecule of the invention is useful for treating CC retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood cyan countries and development of tissues, tissue regeneration and organ cand tissue repair in a subject. The products of the invention are useful CC for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-x protein contribution. This sequence represents the human VEGF aprotein protein and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-x protein protein and organ repair by promoting angiogenic activity or vascularization. This sequence represents the human VEGF-x protein protein and organ repair by promoting any protein activity or vascularization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Best Local Similarity 46.7%;

                                                                                                                                                                                                                         CC (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has coulmbrary, cytostatic, antirheumatic, antiarthritic, antiparoriatic and candidabetic activity and acts as an angiogenesis and vascularization cregulator. An antisense molecule of the invention is useful for treating corpreventing cancer; rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate cartivity and development of tissues, tissue regeneration and overland to the invention of new blood vascularization including formation and proliferation of new blood cyanularization including formation and proliferation of new blood cyanularization including formation and proliferation of new blood cyanularization and development of tissues, tissue regeneration are useful corpreparing medicaments for treating wounds such as dermal ulcers, corpressure sores, venous sores, diabetic ulcers and burns and to promote skin graft growth, tissue repair, proliferation of new blood vessels, corpressure sores, the tissue repair by promoting angiogenic activity or vascularization. This sequence represents a human VEGF-X protein corposite the method of the invention.

                                                                                                                                                                                                      This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an antiagenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting anglogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration and organ and tissue repair in a subject. The products of the invention are useful for preparing medicaments for treating wounds such as dermal ulcers, pressure sores, venous sores, diabetic ulcers and burns and to promote this great troubs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 VEGF-X; vascular endothelial growth factor; human; vulnerary; cytostati antirheumatic; antiarthritic; antipsoriatic; antiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAB10653 standard;

Novel cDNA encoding human bone morphogenic proteins, vectors, cells and methods of recombinant production, useful for diagnotreatment of, e.g. bone disorders $\,\cdot\,$ ectors, host diagnosis ar and

Claim 11; Page 184-185; 187pp; English.

by standard recombinant methodology. Determining the presence or absence of a mutation in the polynucleotides or determining the presence or amount of expression of the polypeptides is useful for diagnosing a pathological condition or a susceptibility to a pathological condition in a subject. The polynucleotides can also be used to prevent, treat or ameliorate a medical condition. The proteins are useful for diagnosis and/or treatment of diseases associated with BMPs, in particular bone disorders (e.g. osteoarthritis, cartilage defects and tissue repair), and in particular for stimulation of angiogenesis. The polynucleotides are useful as reagents for differential identification of tissues or celements are useful as reagents. The invention provides novel human bone morphogenic proteins (BMP) and nucleic acids encoding the BMPs. The BMP polypeptides can be expressed biological samples. The polynucleotides can be used absence

                                                                                                                                                                                      The sequence represents the amino acid sequence of novel human protein, NHP #3, isolated from a human adremal gland cDNA library. NHP nucleotides are useful for drug screening and clinical trial monitoring, and for the diagnosis and treatment of physiological or behavioural disorders, cancer and infectious disease. Nucleotide constructs encoding functional NHPs, mutant NHPs, as well as antisense and ribozyme molecules can also be used in gene therapy for the modulation of NHP expression. NHP polypeptides may be used to produce agonists, antagonists and antibodies for the regulation of NHP expression in the treatment and/or diagnosis of
                                                                                                                                         Sequence

The present sequence represents a human platelet-derived growth factor C (PDGF-C) (formally designated VEGF-F) fragment. PDGF-C polypeptides have Ct the ability to stimulate and enhance proliferation or differentiation, CC and/or growth or motility of cells expressing a PDGF-C receptor. CPDGF-C polypeptides can be used in pharmaceuticals for promoting cell CC proliferation, preferably in combination with one other growth factor C and heparin. Pharmaceuticals comprising PDGF-C polypeptides can also be used for stimulating connective tissue or wound healing. The PDGF-C and used to regulate the receptor-binding specificity of PDGF-C and also be used, to promote fibroblast CC mitogenesis in a mammal and to induce PDGF alpha receptor activation. CC PDGF-C antagonists can be used to inhibit tumour growth of a tumour expressing PDGF-C in a mammal. Specific types of human tumours, e.g. choriocarcinoma, Wilms tumour, megakaryoblastic leukaemia, lung carcinoma CC and erythroleukemia, can be identified by testing for expression of PDGF-C antagonists can also be used to inhibit tissue cremodelling during invasion of tumour cells into a normal population of CC cells. Antagonists can also be used to treat fibrotic conditions, CC especially found in the lung, kidney or liver.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-DEC-1998;

                                                                                                                                                                                                                Polynucleotide sequences AAF17982 - AAF18424 encode human lung cancer associated proteins represented in AAB58166 - AAB58548. Lung cancer associated proteins and polynucleotide sequences, their agonists, and antagonists may have neuroprotective; cytostatic; cardioactive; immunomodulatory; muscular active general; vulnerary; gastrointestinal general; nephrotropic; antiinfective; gynecological; or antibacterial activity. The invention also includes antibodies specific for the protein or polynucleotide sequences. The lung cancer associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cardioactive; immunomodulatory; muscular active; vulnerary; gastrointestinal; nephrotropic; antiinfective; gynecological; antibacterial; diagnosis; neural disorder; immune disorder; prolliferative disorder; wound healing; infectious disease.
                                                                                   gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders. The proteins may also be used in the treatment of wounds an infectious diseases. Polynucleotide sequences AAF18425 - AAF18433 and peptide AAB58549 are used in the course of the invention for the identification and characterisation of the polynucleotide and protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Lung
                                           Sequence
                                                                                                                                                          diagnostic or research purposes. The proteins may be used disorders such as neural, immune, muscular, reproductive,
                                                                                                                                                                                       chromosome identification, as chromosome markers, and for numerous
                                                                                                                                                                                                    polynucleotide sequences may be used for detection of lung cancer,
                                                                                                                                                                                                                                                                                                                                                 Claim 11;

                                                                                                                                                                                                                                                                                                                                                                                    screen for antagonists and agonists, and the antagonists administered to treat angiogenic disorders in mammals (especially humans) e.g. cancer or age-related macular degeneration. It can be used to generate antibodies, useful therapeutically as antagonists, as above. The antibodies are also useful to detect VEGF-E polypeptide, especially to diagnose cardiovascular, endothelial or angiogenic disorders in mammals (e.g.
susceptibility to a disease related to a mutated form of VEGF-E (e.g. a cardiovascular, endothelial or anglogenic disorder such as a tumor), by detecting a mutation in the VEGF-E-encoding sequence isolated from a sample. They may also be used to produce probes useful to detect related sequences or for gene mapping. This sequence represents the human VEGF-E protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       endothelial cell growth factor-E (VEGF-E) polypeptide which has tranquillizer, vulnery and cardiant activity. VEGF-E can be administered therapeutically, especially by expressing encoding polynucleotides, to treat cardiovascular or endothelial disorders in mammals, especially
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       tissue generation; regeneration; angiogenic disorder; age-related
                                                                                                                                                                                                                                                                                                  of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        humans. It is useful in wound repair and tissue generation and regeneration, and may especially be used to treat cardiac hypertrophy. It can be combined with a carrier in pharmaceutical compositions, which can be administered to treat disorders as above. VEGF-E can be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes the isolation of a novel human vascular

      The present invention describes secreted and transmembrane polypeptides and their polynucleotides. The nucleotide sequences are useful as sources of probes, primers, for chromosome mapping, and for generation of antisense sequences. They can also be used to create transgenic animals. The proteins can be used to treat a variety of diseases and disorders, depending on their function. Diseases that may be treated include blood coagulation disorders, cancers and cellular adhesion disorders. They may also be used to raise antibodies. AAZ33891 to AAZ3438, and AAY41685 to AAY41774 represent polynucleotide and polypeptide sequence given in the exemplification of the present

                                                                                                                                                                                    Growth,
VEGF-R c
                                                                                                                                                                                                                             The present sequence represents a vascular endothelial growth factor related (VEGF-R) protein. VEGF-R can be used in assays to identify compounds that bind to it or that antagonize its activity. VEGF-R antagonists (e.g. anti-VEGF-R antibodies) are useful for inhibiting tissue growth. This is useful for inhibiting tumour growth and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor related protein; VEGF-R protein; tissue growth inhibition; tumour growth; cancer; tissue growth; angiogenesis; coronary artery blockage.

The invention relates to the human growth factor homologue zvegf4 (2) (AAB48653), and nucleic acids encoding it (AAC81555). Zvegf4 is a member of the PDGF (platelet-derived growth factor)/PEGF (vascular endothelial growth factor) family. Zvegf4 has a growth factor domain (AAB48654) characterised by a PDGF cystine knot structure, and a CUB domain (AAB48655) which has a beta barrel structure. Zvegf4 has PDGF-like (AAB48655) which has a beta barrel structure. Zvegf4 has PDGF-like cells and pericytes, and has also been shown to stimulate bone growth. The invention also relates to fusion proteins comprising human cyegf4 or fragments thereof, particularly human zvegf4/human zvegf4 conscience to fusions; expression constructs and host cells comprising human zvegf4 nucleic acids; the recombinant expression of human zvegf4; an antibody which binds to human zvegf4 or a fragment thereof; a method of activating the proliferation, differentiation, migration or method of modulating the proliferation, differentiation, migration or metabolism of bone cells, comprising exposing bone cells to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            03-MAY-1999;

                        metabolism of bone cells, comprising exposing bone cells to zvegf4-derived polypeptides; and a method of detecting a genetic abnormality in the zvegf4 gene of a patient. Zvegf4 proteins and derived fragments may be used to stimulate tissue development or repair, or cellular differentiation or proliferation. They are particularly used for the treatment or repair of liver damage, and may also be used to modulate neurite growth (e.g., in the treatment of Alzheimer's disease or multiple sclerosis). Due to their osteogenic activity, they may be used in the treatment of periodontal disease and fractures. They may also be used to enhance expansion and mobilisation of haematopoietic stem cells and endothelial precursor stem cells, which may be useful in the treatment of ischaemia, in wound healing, and in the modulation of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; zvegf3; zvegf4 fusion; growth factor homologue; VEGF/PDGF family; CUB domain; pDGF-like activity; mitogenic; osteogenic; neovascularisation; tissue regari; proliferation; differentiation; liver damage; neuroregenerative; Alzheimer's disease; multiple sclerosis; periodontal disease; bone fracture; wound healing; vulnerary; ischaemia; immunomodulation; hepatic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 48; Page 125-126; 143pp; English.

                                                                                                                                                                                                                                     The present invention describes a method for enhancing tissue growth, promoting wound healing or stimulating smooth muscle growth by administering a platelet-derived growth factor (PDGF) related protein, designated LP8 or its analogue. Also described is a method of slowing the progress of atherosclerosis or treating atherosclerosis comprising the administration of an LP8 antagonist. The method is useful for enhancing tissue growth, promoting wound healing and stimulating smooth muscle growth. Antagonists of LP8 are useful for treating atherossis. The present sequence represents human LP8, which is also called VEGFh.

                                                                                                                              AAC78458 to AAC78599 represent polynucleotide and EST (expressed sequence tag) sequences which encode secreted or transmembrane PRO polyneptides. The PRO polynucleotides and polypeptides have cytostatic activity. The polynucleotides and polypeptides can be used for detecting molecules to cells and for modulating biological activities of cells, using the polypeptides for specific targeting. The polypeptide targeting can be used to kill the target cells, e.g. for the treatment of cancers. The polypeptide to AAC7800 to AAC78907 represent PCR primers and probes used in the isolation of the PRO polynucleotide sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                     WPI;

                                                           Matches
                                                                                                                                                                                                                                         This invention describes a novel vascular endothelial growth factor-X (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and antidiabetic activity and acts as an angiogenesis and vascularization regulator. An antisense molecule of the invention is useful for treating or preventing cancer, rheumatoid arthritis, psoriasis and diabetic retinopathy by inhibiting angiogenic activity or inappropriate vascularization including formation and proliferation of new blood vessels, growth and development of tissues, tissue regeneration are useful for the invention are useful for the products of the invention are useful
                                                                                                                                                   skin graft growth, tissue repair, proliferation of new blood vessels, tissue regeneration and organ repair by promoting angiogenic activity vascularization. This sequence represents the RACE generated human VE protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                              New vascular endothelial growth factor protein, useful for treating or preventing diseases associated with inappropriate angiogenesis activity such as cancer, rheumatoid arthritis, psoriasis and wounds -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antirheumatic; antiarthritic; antipsoriatic; antidiabetic; treatment; angiogenesis regulator; vascularization regulator; cancer; psoriasis; rheumatoid arthritis; diabetic retinopathy; blood vessel; organ repair; tissue regeneration; tissue repair; wound; dermal ulcer; pressure sore;

CC (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has CC (VEGF-X) protein (Ia) and its encoding polynucleotide (IIa) which has CC vulnerary, cytostatic, antirheumatic, antiarthritic, antipsoriatic and CC antidiabetic activity and acts as an angiogenesis and vascularization CC regulator. An antisense molecule of the invention is useful for treating CC or preventing cancer, rheumatoid arthritis, psoriasis and diabetic CC retinopathy by inhibiting angiogenic activity or inappropriate CC vascularization including formation and proliferation of new blood CC vessels, growth and development of tissues, tissue regeneration and organ CC and tissue repair in a subject. The products of the invention are useful CC for preparing medicaments for treating wounds such as dermal ulcers, CC pressure sores, venous sores, diabetic ulcers and burns and to promote Skin graft growth, tissue repair poliferation of new blood vessels, consideration. This sequence repersents the human VEGF-X protein consideration in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAB10634
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     RESULT 30

Sequence 4, Application US/07973324A Patent No. 5460952

GENERAL INFORMATION:
APPLICANT: Yu, Su
APPLICANT: Liu, L

Yu, Su-May

NUMBER OF SEQUENCES: 7
CORRESPONDENCE ADDRESS:

STREET: Chicago

ADDRESSEE:

E: Marshall, O'Toole, Gerstein, Murray & Borun 6300 Sears Tower, 233 South Wacker Drive

COUNTRY:

United States of America

Illinois

60606-6402

APPLICANT: Liu, Li-Fei
TITLE OF INVENTION: Gene Expression System Comprising the
TITLE OF INVENTION: Promoter Region of the Alpha-Amylase Genes

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:

Sequence 8, Application US/08333358

Patent No. 5571696

GENERAL INFORMATION:
APPLICANT: EVANS Ph.D., RONALD M.
APPLICANT: MANGELSDORF Ph.D., DAVID J.
APPLICANT: ORG MS., ESTELITA S.
APPLICANT: ORG MS., ATHONY E.
APPLICANT: GROMEYER Ph.D., UWE K.
APPLICANT: GROMEYER Ph.D., VINCENT NMN
APPLICANT: GROMEYER Ph.D., VINCENT NMN
APPLICANT: YAO Mr., TSO-PANG NMN
TITLE OF INVENTION: NOVEL RECEPTORS
NUMBER OF SEQUENCES: 14
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          HOLECULE TYPE: PCT-US94-07266-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ATTOREY/AGENT INFORMATION:
NAME: FERRARO, GREGORY D.
REGISTRATION NUMBER: 36,114
REFERENCE/DOCKET NUMBER: 3258
